

# Computer Environments and systems

You are smarter than computers! Trust yourself..

# Computer components

- ▶ Two types:
  - Hardware and software
- ▶ Hardware is anything that you can touch/feel
- ▶ Software is anything that you cannot feel/touch or is virtual

# Hardware Components

- ▶ **CPU (Central Processing Unit)**
  - ▶ Acts as the brain of the computer, executing instructions.
  - ▶ Higher clock speed and more cores lead to faster processing, crucial for multitasking and demanding applications.
- ▶ **RAM (Random Access Memory):**
  - ▶ Provides temporary storage for data and instructions currently in use by the CPU.
  - ▶ More RAM allows for smoother multitasking and handling of large files or applications.
- ▶ **ROM (Read-Only Memory):**
  - ▶ Stores firmware and essential system instructions.
  - ▶ Remains intact even when the computer is powered off, ensuring essential startup processes.
- ▶ **Cache:**
  - ▶ Provides high-speed storage directly accessible by the CPU.
  - ▶ Faster access to frequently used data, enhancing overall system performance.

# Hardware Components

- ▶ **Hard Drive (or Solid State Drive - SSD):**
  - ▶ Stores data persistently, including the operating system, software, and user files.
  - ▶ Higher capacity drives offer more storage space for multimedia files, programs, and documents.
- ▶ **Motherboard:**
  - ▶ Connects and coordinates communication between all internal components.
  - ▶ Compatibility with CPU, RAM, and expansion cards is crucial for system stability and performance.
- ▶ **Power Supply:**
  - ▶ Supplies electrical power to all components within the computer.
  - ▶ Sufficient wattage and stable voltage output are essential for reliable operation.
- ▶ **Video Card (Graphics Processing Unit - GPU):**
  - ▶ Handles rendering of graphics and visuals.
  - ▶ Higher performance GPUs enable smooth gaming, video editing, and graphical workloads.
- ▶ **Sound Card:**
  - ▶ Processes audio signals for playback and recording.
  - ▶ Higher quality sound cards deliver clearer audio and support for advanced audio features.

# Group Activity

- ▶ In your group, play the following game. The group with the lowest time and the most correct answer wins:

<https://wordwall.net/resource/10827661/computing/parts-of-a-computer>

- ▶ Peripheral Devices:
  - ▶ These are not essential to the functioning of a computer but enhances its functionality. It can be both output and input device!
  - ▶ E.G.- printers, monitor, scanner, keyboard, mouse, speaker, USB drives called?

# Individual Activity - Computer Hardware

- ▶ [\\*\\*More to read: <https://edu.gcfglobal.org/en/computerbasics/inside-a-computer/1/>](https://edu.gcfglobal.org/en/computerbasics/inside-a-computer/1/)
- ▶ Make a summary in your own words that explains the function of each major component of a computer system based on what you read and watched.
- ▶ Make a list of 10 things you think are the most important things to understand about computer hardware for somebody who doesn't understand anything about computers.
- ▶ Submit it in google classroom

# Processors!

- ▶ To be continued!

# Things get a bit more complex!-- Software

- ▶ Software refers to a collection of instructions, programs, and data that enable computers to perform specific tasks or functions. It encompasses everything from operating systems to applications and utilities.
- ▶ Types of software:
  - ▶ Operating Systems
  - ▶ Application Software
  - ▶ Utility Software
  - ▶ Programming Software
  - ▶ System Software

**\*\*Your task- In group, give atleast two examples for each types of software**

# Types of Software

- ▶ **Operating Systems (OS)**
  - ▶ Controls hardware resources and provides a platform for running applications.
  - ▶ Examples:
- ▶ **Application Software:**
  - ▶ Designed for specific tasks or user needs, such as word processing, graphic design, web browsing, and multimedia playback.
  - ▶ Examples:
- ▶ **Utility Software**
  - ▶ Aids in managing, maintaining, and optimizing computer systems, ensuring security, performance, and data integrity.
  - ▶ Examples:

# Types of Software

- ▶ **Programming Software:**
  - ▶ Provides tools for developers to write, test, and debug software applications and scripts.
  - ▶ Examples:
- ▶ **Systems Software:**
  - ▶ Facilitates communication between hardware components and the operating system, ensuring proper functionality.
  - ▶ Examples:

# Types of Software

- ▶ **Operating Systems (OS)**
  - ▶ Controls hardware resources and provides a platform for running applications.
  - ▶ Examples: Windows, macOS, Linux, Android, iOS
- ▶ **Application Software:**
  - ▶ Designed for specific tasks or user needs, such as word processing, graphic design, web browsing, and multimedia playback.
  - ▶ Examples: Microsoft Office Suite (Word, Excel, PowerPoint), Adobe Photoshop, Google Chrome, Spotify
- ▶ **Utility Software**
  - ▶ Aids in managing, maintaining, and optimizing computer systems, ensuring security, performance, and data integrity.
  - ▶ Examples: Antivirus software (Norton, McAfee), Disk Cleanup tools, Backup software

# Types of Software

- ▶ **Programming Software:**
  - ▶ Provides tools for developers to write, test, and debug software applications and scripts.
  - ▶ Examples: Integrated Development Environments (IDEs) like Visual Studio, PyCharm, Eclipse
- ▶ **Systems Software:**
  - ▶ Facilitates communication between hardware components and the operating system, ensuring proper functionality.
  - ▶ Examples: Device drivers, Firmware

# Why do we need software?

- ▶ Enables Functionality: Without software, computers would be inert machines incapable of performing tasks.
- ▶ Enhances Productivity: Applications streamline processes and automate tasks, boosting efficiency and productivity.
- ▶ Facilitates Communication: Software enables communication through email clients, messaging apps, and social media platforms.
- ▶ Supports Innovation: Constant development and improvement of software drive technological advancements and innovation across industries.

# How does the computer understand what you type or give as input?

- ▶ A high-level language (HLL) is a programming language, such as C, python, java, PHP, C# etc. that allows a programmer to develop programmes that are independent of the type of machine they are running on
- ▶ Computer does not understand high level language---Lol!
- ▶ Computers only understand machine code which is in binary either 0s or 1s
- ▶ Before next class, read the following:
  - ▶ <https://optima-systems.co.uk/how-does-a-computer-understand-a-programming-language/#:~:text=Computers%20only%20understand%20machine%20code,binary%20code%200s%20and%201s.>

High-level programming language

Source Code

Preprocessor

Compiler

Assembly code

Assembler

Object code / Object files and libraries

Linker

Machine code

# High Level Vs Low Level

- ▶ Programming languages can be categorized based on their abstraction level, with high-level and low-level languages representing two ends of the spectrum. Understanding their differences is crucial for choosing the right tool for specific programming tasks.

# High Level Vs Low Level

Criteria	High Level Programming/Source Code	Low Level Programming/Machine Code
Abstraction Level	High-level languages abstract away hardware details, focusing on solving problems.	Low-level languages offer minimal abstraction, providing direct control over hardware resources.
Ease of Use	High-level languages are more user-friendly, with syntax closer to natural language.	Low-level languages require a deeper understanding of hardware and typically involve more complex syntax.
Performance	High-level languages prioritize ease of development over raw performance, although modern high-level languages are often optimized for speed.	Low-level languages offer greater control over performance optimization, resulting in potentially faster and more efficient code.
Portability	High-level languages are more portable, as they are designed to run on different platforms with minimal modifications.	Low-level languages may require significant adaptation to run on different hardware architectures or operating systems.
Example	Python, Java, C#, JavaScript, Ruby etc.	Assembly language, Machine code.
